## AVIAN INFLUENZA INFORMATION SHEET

### Avian Influenza and Food Safety

#### FAST FACTS:

- Highly Pathogenic Avian Influenza (HPAI) is a highly infectious disease of chickens and turkeys and frequently results in sudden death.
- Although avian influenza is a highly contagious disease to domestic poultry, there are no apparent risks with this particular strain to human health from domestic poultry or domestic poultry products at this time.
- It is safe to eat properly handled and cooked poultry products, including meat and eggs. Cook chicken or turkey to 165°F to destroy the virus and cook eggs until both the white and the yolk are solid.
- Use a separate cutting board for poultry, and clean and disinfect the cutting board after use.
- Wash hands thoroughly after handling raw poultry, and before handling any other food.
- Shell eggs produced commercially are surface-sanitized.

**For more information about all aspects of avian influenza, visit [datcp.wi.gov](http://datcp.wi.gov).**

**If you find a sick or dead bird, don't touch it, report it.**
