Protecting your farm from avian influenza

FAST FACTS:

- Highly Pathogenic Avian Influenza (HPAI) is a highly infectious disease of chickens and turkeys and frequently results in sudden death.

- Although avian influenza is a highly contagious disease to domestic poultry, there are no apparent risks with this particular strain to human health from domestic poultry or domestic poultry products at this time.

- Protect your flock by practicing good biosecurity:
  - Sanitize equipment and clothing used around them;
  - Protect them from contact with wild birds; and
  - Restrict access to your property and keep your birds away from other birds.

- It is safe to eat properly handled and cooked poultry products, including meat and eggs.

For more information about all aspects of avian influenza, visit datcp.wi.gov.

If you find a sick or dead bird, don’t touch it, report it.
